EXP 4	**Analyze and compare the text generation capabilities of different LLM architectures and access methods (OpenAI API vs Hugging Face).**

AIM:

To compare text generation using **OpenAI API (GPT-4.1-mini)** and **Hugging Face GPT-2** on a common prompt, and evaluate output quality and similarity using **TF-IDF cosine similarity**.

PROCEDURE:

1. **Import Libraries:** Import OpenAI client library for API access, Hugging Face transformers pipeline for local model inference, and sklearn's TfidfVectorizer and cosine_similarity for output comparison.
2. **Configure Parameters:** Set the OpenAI API key, select the OpenAI model (gpt-4.1-mini), select the Hugging Face model (gpt2 or gpt2-medium), and define the shared prompt asking about LLM architecture comparison.
3. **OpenAI Text Generation:** Instantiate the OpenAI client with the API key. Call the chat completions endpoint using the configured model with max_tokens=200 and temperature=0.7. Extract and return the response text from the API response object.
4. **Hugging Face Text Generation:** Load the GPT-2 model using the Hugging Face pipeline() function with the text-generation task. Run inference on the same prompt with max_length=200, temperature=0.7, and num_return_sequences=1. Return the generated text string.
5. **Calculate Similarity:** Convert both generated outputs into numerical vectors using TF-IDF vectorization. Compute cosine similarity between the two vectors to measure how semantically similar the outputs are on a scale of 0.00 (no similarity) to 1.00 (identical).
6. **Display and Analyze Results:** Print the shared prompt, both model outputs, and the similarity score in a structured format. Include a qualitative analysis covering output quality, architecture insights (decoder-only vs encoder-decoder), and API access method trade-offs.
7. **Run Main Function:** Call main() from the entry point to orchestrate all steps: generate text from both models, calculate similarity (set to 0.0 if either model errors), and display the full comparison report.

======================================================================
HUGGING FACE OUTPUT:
Analyze and compare the text generation capabilities of different LLM architectures
(decoder-only, encoder-decoder) and access methods (OpenAI API vs Hugging Face).

Learn about the LLM architecture and how it works with OpenAI.
Learn about the underlying LLM architecture and how the OpenAI API uses it.

======================================================================
SIMILARITY SCORE: 0.00

======================================================================
ANALYSIS:

1. OpenAI (Decoder-based GPT):
   - Produces coherent, structured, high-quality text
   - Better reasoning and context handling

2. Hugging Face (GPT-2):
   - Output quality depends on model size
   - Less coherent for long responses

3. Architecture Insight:
   - Decoder-only: best for generation
   - Encoder-decoder: better for tasks like translation

4. API Insight:
   - OpenAI: easy, powerful, managed
   - Hugging Face: flexible, customizable, requires setup

======================================================================
```

Result:

Text was successfully generated using both **OpenAI API (GPT-4.1-mini)** and **Hugging Face GPT-2**. OpenAI produced a concise, coherent response while GPT-2 generated repetitive continuation text, reflecting its smaller size and lack of fine-tuning. The **cosine similarity score of 0.00** confirmed the outputs were semantically distinct, demonstrating that model scale and access method significantly affect generation quality.
